Glycoprotein B precursor - Marek's disease virus (strain RBIB)
C:Species: Marek's disease virus
C:Species: Marek's disease virus
C:Species: Marek's disease virus
C:Species: Marek's disease virus
C:Date: 31-Dec-1991 #sequence_revision 31-Dec-1991 #text_change 16-Jun-2000
C:Accession: A32402; B32402
C:Accession: A32402; B32402
A;Title: Nucleotide sequence and characterization of the Marek's disease virus homologue
A;Reference number: A32402; MUID:89293086; PMID:2544666
A;Accession: A32402
A;Mclecule type: DNA
A;Residues: 1-865 <ROS>
A;Cross -references: GB:D13713; EMBL:D00506; NID:g221836; PIDN:BAA02866.1; PID:g221837
A;Accession: B32402
A;Mclecule type: protein
A;Residues: 250-271:304-330 <ROS2>
A;Mclecule type: protein

A.Title: The complete genome sequence of Escherichia coli K-12.
A;Reference number: A64720; MUID:97426617; PMID:9278503

A.Accession: C64798

A;Status: nucleic acid sequence not shown; translation not shown

A;Molecule type: DNA

A;Residues: 1-69 <BLAT>
A;Cross-references: GB:AE000168; GB:U00096; NID:91786849; PIDN:AAC;
A;Experimental source: strain K-12, substrain MG1655
C;Genetics:
A;Gene: ybeB

A;Map position: 15 min
C;Superfamily: Escherichia coli ybeB protein
                                                                                                                                                                                                                                                                                                                                                        hypothetical protein ybeB [imported] - Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escherichia coli (strain 0157:H7, sul c;Speciles: Escheri

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW05768-W05788 represent antigenic fragments of the human presentlin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presentlin-1 that results from alternate splicing of the genomic DNA sequence. The presentlins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that
                                                                                                                                                                                                                                                                   Early onset Alzheimer's expressed sequence tag;
                                                                                                                                                                                                                                                                                                             Early
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New presentlin genes - useful for diagnosis, therapy and drug screening of familial Alzheimer's disease, cerebral disorders, etc.
                                                                                                                                        Misc-difference

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A set of polypeptides (AAW11786-91) have sequences deduced from the 3 reading frames, of both strands, of a human activated T-cell cDNA clone (AAT59473) that corresponds to an expressed sequence tag (EST) of the early onset Alzheimer's disease (EOAD) gene. EOAD gene products (see also AAW11768-85 and AAW11792-97) can be expressed in host cells and used to screen for agonists or antagonists useful in EOAD therapy, or to raise antibodies useful in the diagnosis of EOAD or predisposition to EOAD.

(N.B. in-frame stop codons in the 6 reading frames of the cDNA clone are ignored in the translated polypeptide sequences given in
                                                                                                                                                                                                                                                                                                                                                              Chimeric - Bacteria.
Chimeric - Unidentified.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the field of plaque amyloid deposits that are the hallmarks of Alzheimer's disease. In particular, the invention relates to an isolated, functionally-active protein that has gamma-secretase activity. Gamma-secretase activity is necessary for amyloid production. The present invention also relates to methods for isolating integral-membrane proteins and protein complexes, including the gamma-secretase protein of the invention. The method is useful for monitoring the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the protein contains the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the protein contains the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the protein contains the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) by damma-secretase when the cleavage of beta-amyloid precursor protein (betaAPP) are the cleavage of beta-amyloid precursor protein (betaAPP) and the cleavage of beta-amyloid precursor protein (betaAPP) are the cleavage of beta-amyloid precursor protein (betaAPP) and the cleavage of beta-amyloid precursor protein (betaAPP) and the cleavage of beta-amyloid precursor protein (betaAPP) and the cleavage of beta-amyloid precursor protein (betaAPP) and the cleavage o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by gamma-secretase. The present sequence is a fusion protein comprising Bacterial glutathione-S-transferase (GST) and presentlin peptide, PS1 loop. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel gamma secretase capable of cleaving be amyloid peptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Misc-difference

This sequence is the PS1/429 presentilin peptide (II) of the Invention. Cells transformed with the DNA are used to produce recombinant (II) and analogues, useful e.g. as immunogens for generating an immune response against PS1/429. (II) is a new product of the PS1 gene, mutations in which cause Alzheimer's disease (AD). The nucleic acids are
                                                                                                                                                                                                                                              18-JUL-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying genes which cause improper chromosome segregation, screening for inhibitors of chromosome missegregation and processe caused by genes encoding chromosome missegregation promoters was exemplified using Alzheimer's disease. The sequences given in AAT87401 to AAT87426 can be used in the above methods. The five mutations indicated in the Peatures Table cosegregate with early-onset familial Alzheimer's disease. It is predicted that these mutations result in increased levels of cells with trisomy 21 in carriers of the mutation compared with non-carriers.

Antibodies (Ab) can also be diagnosed at the protein level using AD as immunoassay reagents. AD can also be used to identify epitopes and for affinity purification of peptides. Antisense nucleic acid may also be used to regulate expression of the PS1/429 gene, and both nucleic acids and peptides are useful as size markers in electrophoresis, chromatography etc. The transgenic animals are used as models for AD, e.g. for testing drugs. Regulators of the PS1/429 gene or polypeptide can be used to treat e.g. AD or diseases involving mitochondrial pathology, apoptosis and neurodegeneration. Typical regulators are antisense sequences, ribozymes, aptamers, synthetic or natural compounds. (II) may also be used to target other coding sequences to particular cellular locations.
                                                                                                                                                                                                                                    31-JUL-1995;

Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             e
```

AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of

            AAW05736-W05760 represent mutated versions of the human presentiin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presentilin-1 that results from alternate splicing of the genomic DNA sequence. The presentlins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot
                                                                                                                                                                                                     Claim

Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc. so detection of mutations the DNA encoding the wild type sequences can be used for diagnosis of containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are useful as models for drug screening. The antibodies can also be used e.

AAW05733 and AAW05734 represent the two different forms of wild type human presentiin-1 (PS-1). This form of presentlin-1 results from alternate splicing of the genomic DNA sequence. AAW05762 represents the coding sequence for wild type human PS-2. The presentlins are a family of highly conserved integral membrane proteins with a common structural methic, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral haemornhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding these sequences can be used for diagnosis of these diseases. These proteins, or vectors that express them or containing antisense sequences, antibodies selective for mutant forms of these proteins (such as AAW05738) and modulators of PS gene expression are
                                                                                                                                                                                                                     Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                31-JUL-1995;
28-APR-1995
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alzheimer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used efor affinity purification and in immunoassays.

                                                                                                                   disease (FAD) patients, 6 late onset sporadic Alzheimer's disease (AD) patients and 4 neurologically normal subjects, indicated that mRNA transcripts of the presentlin 1 gene in samples from various brain regions occur in 2 forms, PS-1-long (containing a VRSQ motif) and PS-1-short (lacking the VRSQ motif, i.e. the protein denoted by the present sequence), and that the PS-1-long levels in hippocampus and frontal cortex samples are significantly lower in FAD patients than in AD and normal subjects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g. for affinity purification and in immunoassays.
                                                                                                                                                                                                                                                                               transcript in a sample of genetic material, where the alternative splice site encodes AAW22944, or detecting AAW22944 in the protein encoded by the mRNA. Tests on 3 early onset familial Alzheimer's

Several mutations the S182 gene have been found in families with members affected by early onset Alzheimer's disease (AD): in 2 families Met to Val at position 135; in 3 families Met to Val at 142; in 1 family Pro to Ser at 263; in 4 families Glu to Ala at 276; and in 1 family Glu to Gly at 280. Detection of the mutations is used to diagnose AD, or a predisposition to it. Transgenic animals can be produced that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New mutants of the S182 gene associated with familial disease - and related protein and transgenic animals, models for screening and assessing potential drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-JUN-1996;

A 467-amino acid polypeptide (AAW11839) is the product of a full-length cDNA (AAT59535) of the EOAD gene. The 2 polypeptides can be produced in transformed host cells and used to raise antibodies, or to identify antagonist/inhibitor cpds. useful in the treatment of Alzheimer's disease, esp. EOAD.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disease, Down's Syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA mather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated proteins Tau and Big Tau, ubiquitin B, apolipoprotein E microtubule associated protein 2 (MAP2), neurofilament-L, neurofilament-M, neurofilament-F, presenilin II, presenilin II, glial fibrillary acidic protein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma 2 (bcl-2) proto-oncogene, semaphorin III, HUPF-1, high mobility group protein-C (HMGP-C) and neuroendocrine specific protein A.
                                                                                                                            Presenilin-1; PS1 gene; human; familial Alzheimer's disease; cerebral haemorrhage; schizophrenia; depression; epilepsy; mental retardation; diagnosis; therapy; transgenic animal.

                                                                                                                                                                                                                                                                                                                                        and epilepsy. Use of the nucleic acids and proteins comprising or derived from the presentlins is made in screening and dlagnosing FAD, identifying and developing therapeutics for treatment of FAD, and in producing cell lines and transgenic animals useful as models of FAD. Methods for identifying substances that bind to, or modulate the activity of a presenilin protein, and methods for identifying substances that affect the interaction of a presenilin interacting protein with a presenilin protein are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                      acid sequence was deduced from an isolated cDNA clone (see AAV04667). Another hPS1 sequence (see AAW23964) results from alternative splicing of the hPS1 mRNA transcript. A murine PS1 homologue (see AAW23965) and a human presentlin-2 protein (see AAW23967) are also provided. Mutations in the PS-1 and PS-2 genes are linked to the development in humans of forms of familial Alzheimer's disease (FAD) and may be causative of other disorders, e.g. cognitive, intellectual, neurological or physiological disorders such as cerebral haemorrhage, schizophrenia, depression, mental retardation and epilepsy. Use of the nucleic acids and proteins comprising or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated mutant presentiin-1 genes - useful for developing products for use in detection, diagnosis and therapy of Alzheimer's disease and for drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This polypeptide comprises human presentlin-1 (hPS1).

Immunogenic composition comprising diagnosing Alzheimer's disease -
                                                                          WPI; 2000-146863/13
                                                                                                                       L'Hernau
                                                                                                                                                                                                                                                                                                                                                                       US|6019974-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel immunogenic composition comprising at least 1 antigenic component selected from an antigenic peptide (I) (linked to a carrier) or a multiantigenic peptide (II). The composition is useful for diagnosing or monitoring SPE-4 related protein profiles of nematodes and/or Alzheimer's disease patients, either in postmortem tissue, or from other tissue samples, where the tissue is from the brain muscle or peripheral blood cells. The immunogenic composition can be used to diagnose Alzheimer's noninvasively and has neuroprotective and nootropic activity. This sequence represents the human S182 protein which
                                                                                                                                                                                                                                                                                                                          01\FEB-2000
                                                                                                                                                                                                                                                                                                                                                                                                                           Mus sp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        muscle;

          AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural
                                                                                                                                                                                                                                                      31-JUL-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes a novel immunogenic composition comprising at least I antigenic component selected from an antigenic peptide (I) (linked to a carrier) or a multiantigenic peptide (II). The composition is useful for diagnosing or monitoring SPE-4 related protein profiles of nematodes and/or Alzheimer's disease patients, either in postmortem tissue, or from other tissue samples, where the tissue is from the brair muscle or peripheral blood cells. The immunogenic composition can be used to diagnose Alzheimer's noninvasively and has neuroprotective and nootropic activity. This sequence represents the murine S182 protein which is used in the method of the invention.
                                                                                                               New presenilin genes - useful for screening of familial Alzheimer's

                        AAW05736-W05760 represent mutated versions of the human presenilin-1-1 protein (see AAW05733 for wild type sequence). AAW05734 represents a different wild type form of presenilin-1 that results from alternate splicing of the genomic DNA sequence. The presenilins are a family of highly conserved integral membrane proteins with a common structural motif, common alternate splicing patterns, and common mutational hot spot regions. Mutations in PS genes are implicated in familial Alzheimer's disease (AD) and possibly other diseases such as cerebral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               spot regions. Mutations in PS genes are implicated in familial Alzhelmer's disease (AD) and possibly other diseases such as cerebral haemorrhage, schizophrenia, depression etc., so detection of mutations in the DNA encoding the wild type sequences can be used for diagnosis of these diseases. The wild type proteins, or vectors that express them or containing antisense sequences, antibodies selective for these mutant forms of the proteins and modulators of PS gene expression are potentially useful for treatment of AD etc. Transgenic animals are useful as models for drug screening. The antibodies can also be used e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (HSCR-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Presenilin-1; human; hPS1-1; hPS1-2; PS-2; integral membrane protein; familial Alzheimer's disease; cerebral haemorrhage; schizophrenia; depression; antibody; gene expression modulator; therapy; mutein.
